

The desalination of saline and brackish water in countries in climatically dry regions is gaining significance, as increasingly large quantities of desalinated water are required for drinking, irrigation and other purposes. Moreover, independent of geographical conditions, the purification of industrial waste water is of growing importance. In this book a group of process, design, and consulting engineers as well as specialists from the chemical industry present their experience. Their contributions are comprehensive and wide in scope, ranging from the chemical and electrochemical fundamentals of the various processes (such as reverse osmosis, electrodialysis and ultrafiltration) to plant design, plant operations and questions concerning materials of construction. Special emphasis is given to chemical factors necessary to the running of desalination plants. The book is intended for specialists involved in the construction and operation of such plants and for administrative personnel.
